

THE PRIMARY CONCERN

“Resource Scarcity and Environmental Impact”

1. The reasons why

- **Basic Needs and Human Survival:** Population growth directly increases demand for essential resources like food, water, and energy. In many regions, particularly where resources are already scarce, meeting these needs becomes increasingly difficult, leading to food insecurity, water shortages, and even humanitarian crises.
- **Environmental Degradation:** As populations grow, deforestation, fossil fuel consumption, and land degradation often rise, accelerating climate change. This not only threatens ecosystems but also creates a cycle that worsens resource availability, as climate change affects agricultural productivity, freshwater supplies, and biodiversity.
- **Pressure on Sustainable Development:** Balancing the need to improve living standards with environmental sustainability is a significant challenge. In developing regions, where growth rates are often highest, improving living standards is essential, yet rapid industrialization and urbanization can lead to unsustainable exploitation of resources and higher greenhouse gas emissions.
- **Impact on Global Health and Stability:** Scarcity and environmental issues can lead to increased migration, conflicts over resources, and public health risks. As competition for water, land, and food grows, it can contribute to geopolitical tensions and internal conflicts, straining local governments and international stability.
- **Future Generations:** With current growth patterns, future generations face a heavier burden of dealing with degraded ecosystems, fewer natural resources, and a potentially unstable climate. Addressing resource management and environmental conservation now is essential to ensure that future generations inherit a world that can sustain them.

2. Representation to clarify this problem in vary of aspect of population growth

- List of visualization can be used:
 - Population using Choropleth Map
 - Population by Region using Stacked Area Bar Chart
 - Population by Age Group using Stacked Area Bar Chart
 - Population by Births and Deaths Per Year using Line Chart
 - Population Growth Rate using Line Chart
 - Births per year, by world region
 - Child deaths per year
 - Children per woman vs. Natural population growth, 2023
 - Children under age 15, by world region

- Deaths per year
 - Deaths per year, by age group, World
 - Fertility rate: children per woman
 - Population of young, working-age and elderly, World
 - Population Growth Rate by Level Development using Line Chart
- List of potential visualization: Not yet have been choosen

3. Insight Values of this visualization project:

- Draw the big picture of this problem based on popullation growth data
- Take a look about the trend of this problem overtime.
- Give a prediction about this problem in the future.
